

ABSTRACT

A suspension of fibrinogen, thrombin, alcohol and optionally aprotinin is obtained by mixing fibrinogen in alcohol with thrombin in alcohol. The suspension contains fibrinogen and
5 thrombin particles with a Folk Ward mean diameter of 25 - 100 μm . The thrombin may be human, bovine or recombinant. The fibrinogen may be human or recombinant. A method for coating a carrier, such as a collagen sponge, with the suspension, and a method for drying the coating is disclosed. The coated collagen carrier may be used as a ready-to-use absorbable
10 solidly fixed components of fibrin glue, i.e. fibrinogen and thrombin.
